

Valve Technology and Systems IMI NORGREN BUSCHJOST GMBH + CO. KG

Valves have been our mission for over 60 years

Buschjost offers the user a comprehensive range of valves for process liquids and gases.

This catalogue takes the effort out of specifying and choosing solenoid and pneumatically actuated valves.

The standard range is enhanced with customised valves developed, designed and manufactured for virtually all sectors.

The company has a policy of emphasising continuity and reliability. Its workforce is therefore committed to achieving uncompromising quality in partnership with all existing and prospective customers.

Buschjost has anticipated future development by concentrating all of its consultation, development and production capacities in Bad Oeynhausen as direct service channels.

Extensive in-house component production and a cutting-edge, flexible service organisation guarantee ongoing innovation and dependability for tomorrow's changing markets.

Buschjost, from 1967 to 1997 part of the German Herion Group has become a member of the British IMI Group in 1997. The group has a global manpower of more than 16,000 people with an annual turnover of approximately £1.6bn. This demonstrates financial strength and stability that guarantee the customer reliability and continuity.

Group synergies are allowing the company to enormously expand its domestic and particularly its wider operations. Our multinational and exporting partners have come to rely on the high availability of Buschjost products in over 75 countries ensured by the international Norgren marketing companies.

Capacity focused on the future. Buschjost.

TECHNICAL INFORMATION QUALITY MANAGEMENT

Buschjost introduced a Quality Management System to DIN ISO EN 9001 back in 1994.

Quality management

All general management concerned with defining quality policy, objectives and responsibilities within the framework of the QM system, and their subsequent implementation with tools such as:

- Quality planning
- Quality control
- Quality assurance
- Quality management exposition
- Quality improvement

Requirements

- Full interdepartmental involvement
- Coverage of all activities
- Formulation of quality policy
- Setting of quality objectives
- Implementation of quality objectives

Basis of QM system

The Quality Management System is based on documentation describing all departmental QM activities and processes on three levels:

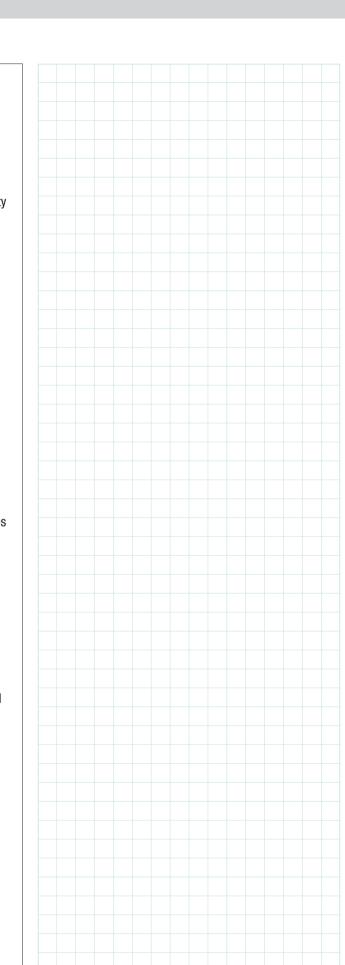

- Quality Management Manual
- Procedural directives
- Work instructions

These directions cover suitable implementation of the defined processes, inspection and testing.

Special testing

Buschjost has been inspected by the TÜV and approved as a manufacturer of products for plant subject to monitoring in accordance with the German Pressure Vessel Regulations (TRB 801 No 45 and TRD 110).

These products have to be supplied with a 3.1. B Approval Test Certificate. Traceability to the starting material has to be ensured for all of their pressurised components.

TECHNICAL INFORMATION VALVE SELECTION CRITERIA

The following factors are important in making the right commercial and technical choice:

- Valve actuation solenoid pressure motorised
- Switching function normally closed normally open
- Connection size flow rate k_{ν} (flow coefficient) value
- Type of connection threaded flanged weld ends
- Working pressure
 upstream of valve
 downstream of valve
 differential pressure
 vacuum
- Process fluid neutral aggressive gas liquid filtered contaminated
- Fluid temperature range from - to + °C
- Ambient temperature range from - to + °C ambient atmosphere
- Solenoid power supply voltage frequency
- Protection classification IP EEx
- Control fluid supply control fluid control pressure temperature of control fluid from - to + °C ambient temperature from - to + °C
- Accessories and options
- Safety requirements
 - TÜV approval/test certificates
 - type examination

Solenoid Valves without Differential Pressure

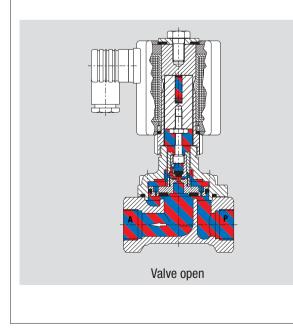

TECHNICAL INFORMATION SOLENOID VALVES WITHOUT DIFFERENTIAL PRESSURE

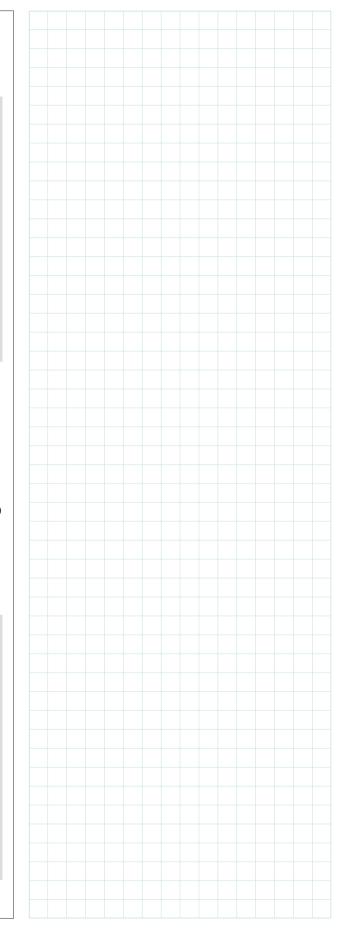

(direct acting or indirect acting with forced lifting)

The force produced by the solenoid plunger, which is mechanically coupled to the main closure device, opens this type of valve. The sequence starts with the solenoid opening the pilot seat. This relieves the pressure on the main closure device, bringing it into balance so the solenoid force can lift it into the open position. When the pilot seat is closed, bleed orifices allow a force to build up on the closure device that pushes it down into the closed position on the valve seat.

These valves are preferred for use where the differential pressure is very low or zero.

2/2-way valves G ¹/₄ - G ³/₈ direct acting solenoid valves

TECHNICAL INFORMATION OPERATING VOLTAGE

We differ basically between DC and AC solenoids. As alternating voltage is more frequently available, it would seem obvious to give preference to the AC solenoids.

However, from a certain size the latter have definite disadvantages in comparison to the DC solenoids in terms of lifetime and magnetic force, and so the DC solenoids with intermediate rectifiers are preferred.

This voltage rectifier is integrated in the socket or with in the solenoid.

The main advantage of the DC solenoid is its constant current consumption, which leads to smooth switching and a coil that can cope with mechanical obstructions.

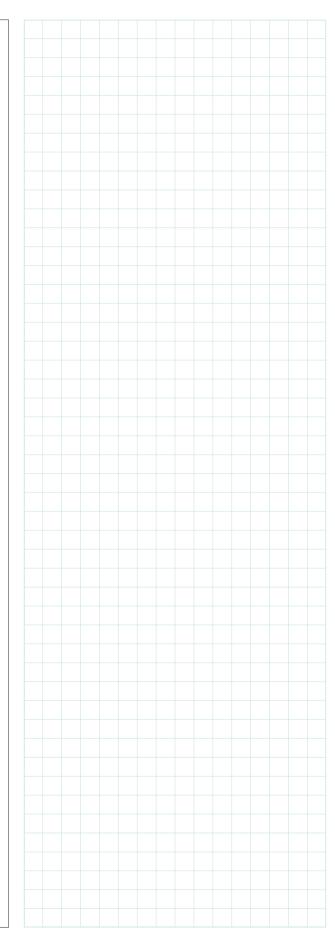

Design measures such as a tapered pole piece and core can tailor the magnetic force characteristic to the requirements.

Overvoltages on breaking (inductive peaks) can be avoided by connecting a varistor, diode or RC-network in parallel.

The current consumption of AC solenoids depends on the position of the core (air gap between core and pole piece). If the core is prevented from reaching its limit, the coil is overheated and can be burnt out.

The voltage tolerances permitted are ± 10 %. If AC solenoids designed for 50 Hz have to be used with 60 Hz, this entails a reduction in performance. In such cases the manufacturer should be consulted beforehand.

DC coils supplied via rectifiers can be operated between 40 and 60 Hz.

TECHNICAL INFORMATION CALCULATING FLOW RATES WITH K_v (FLOW COEFFICIENT)

Valve models must be carefully selected and accurately sized to suit the system application. Once the switching function and the nominal pressure have been chosen, together with the permissible pressure drop across the valve the medium type, density, viscosity, temperature and flow rate govern the connection size.

The flow coefficient tabulated for each valve allows calculation of service parameters such as flow rate or pressure drop for steady-state flow.

 K_v is the flow rate in m³/h of water at a temperature between 5 and 30°C, with a pressure drop of 1 bar across the valve. Its value has been determined for the different models to VDI/ VDE 2173 guidelines and tabulated in the catalogues characteristic data.

Example:

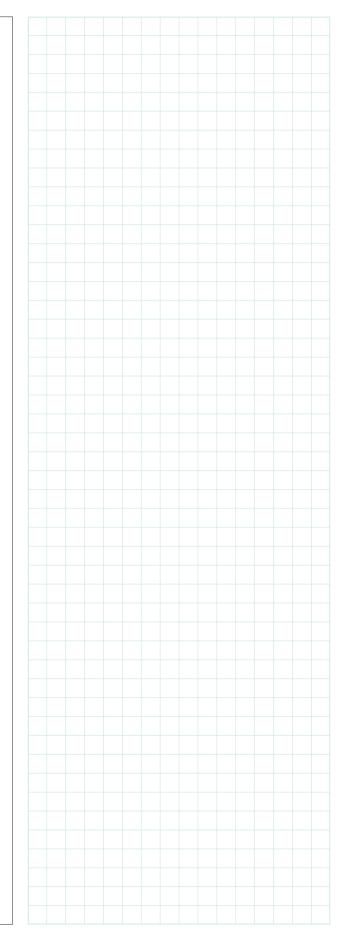

Calculation of the flow rate through 8240400.9101 valve Water at 20°C, $K_v = 9.5$, $\Delta p = 3$ bar

$$Q = K_V x \sqrt{\Delta p}$$
$$Q = 16.45 \text{m}^3/\text{h}$$

Calculation of the pressure drop across 82 404.00.9101 valve Water at 20°C, $Q = 12m^3/h$, $K_V = 9.5$

$$\Delta p = \left(\frac{\underline{Q}}{K_v}\right)^2$$

 $\Delta p = 1.6$ bar

TECHNICAL INFORMATION INSTALLATION & MAINTENANCE

Clean pipework beforehand. Dirty conditions lead to malfunctions, so fit strainer upstream of valve inlet if necessary. The valve will no longer open or close if bleed orifices are blocked or the plunger jammed by dirt.

Avoid distorting the body of the valve in misaligned pipework, or by using inappropriate tools or sealing material. Do not use solenoid as a lever.

The valve will only close tightly in the direction of flow. Flow in the opposite direction to the arrow may irreparably damage components.

The preferred mounting position is with the solenoid upright, as this considerably reduces the risk of wear and contamination. If the fluid temperature exceeds +150 °C or the valve function is normally open, the mounting position is restricted as detailed in the separate publications.

Maintenance

It is advisable to carry out preventive maintenance at intervals depending on the service conditions, and whenever there is a noticeable deterioration in the speed of switching.

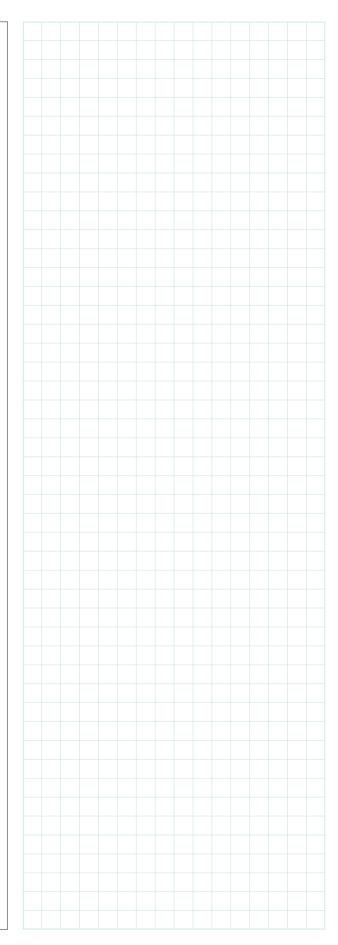

Deposits on guide surfaces, dirt in the valve system, perished or worn seals may lead to malfunctions. To maintain protection, include the solenoid seals in the maintenance.

Maintenance may only be carried out with the pipework depressurised and the solenoid disconnected from the power supply.

Brochures with sectional diagram, key to parts and fitting instructions for kits of parts subject to wear are available on request.

Solenoid surface temperatures may get as high as +120°C during continuous duty!

Leak or strength tests may be carried out with the valve open or closed. The maximum test pressure = 1.5 x maximum working pressure. The valve must not be switched during these tests.

TECHNICAL INFORMATION **EXPLOSION PROTECTION**

Explosion protection has to prevent oxygen, flammable substances and ignition sources arising simultaneously.

Electrical apparatus in hazardous areas must be regarded as an ignition source, and is therefore subject to special building and installation regulations that have undergone international harmonisation.

The members of the "European Committee for Electrotechnical Standardisation", or CENELEC for short, have devised European standards that are identically worded and have been adopted as national standards in all countries. The test certificates issued by the national bodies are therefore recognised throughout the EU.

Hazardous areas are defined as areas in which local and service conditions can give rise to a dangerous, explosive atmosphere. The frequency of occurrence is used to subdivide the areas into zones.

Electrical apparatus installed in these areas must be approved for the relevant zones and marked as defined in EN 50014.

Example: EEx me II T4

EEx

Electrical apparatus with European certification for hazardous areas

Explosion protection technique (e.g. "me")

Type of measures adopted to prevent ignition of the ambient atmosphere

Gas groups (e.g. II)

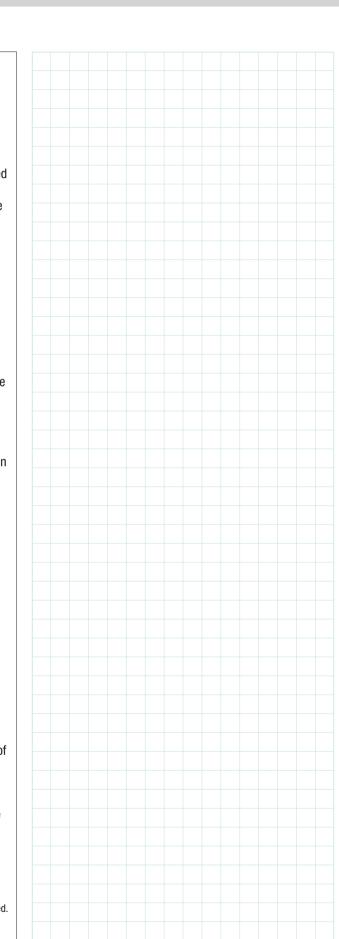

Group I Methane Group II Other explosive gases

Temperature classifications (e.g. T4)

Maximum permissible surface temperature on any part of the electrical apparatus. Ignition temperature of the explosive atmosphere.

The organisation operating the installation is responsible for determining the zone and use of approved apparatus therein.

We will gladly provide you with any further information required.

TECHNICAL INFORMATION LIQUEFIED GAS & VALVES

Liquefied gas applications are synonymous with sophisticated valve technology.

Buschjost has been inspected by the Hanover TÜV and approved as a manufacturer of products in accordance with the German Pressure Vessel Regulations (TRB 801 No 45).

The solenoid valves are certified as meeting the required test criteria. Approvals are covered by authorised 3.1. B DIN 50 049 / EN 10204 test certificates with batch identification.

The requirements for supplying such products are often underestimated.

The first step is to appoint TÜV tested and approved factory experts, who are independent of production and have exclusive certification authorisation.

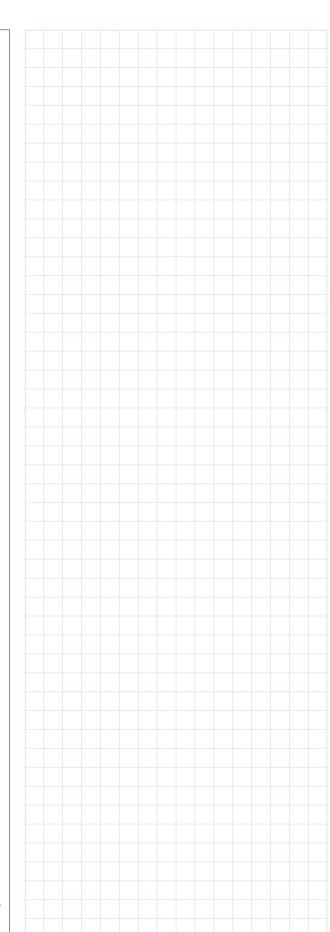

They are also responsible for ensuring the production department adopts all of the measures and specifications applicable to a valve ordered and supplied for a particular application.

These include monitoring of stockkeeping of certified parts, for example ensuring that even the screws procured are never separated from the subcontractor's Approval Test Certificate.

The factory experts are authorised by the TÜV to carry out re-stamping. It is necessary to ensure that certified materials are permanently marked even after machining. Traceability to the starting material must be guaranteed. Expert re-stamping must be carried out before any removal of the original manufacturer's stamp for production purposes.

The TÜV Hannover Sachsen-Anhalt e. V. has approved and registered Buschjost as a manufacturer under the German Pressure Vessel Regulations (TRB 801 No 45).

We will gladly provide you with any further information required.

TECHNICAL INFORMATION ELECTRICAL CONNECTION

Connect solenoid in accordance with the electrical regulations. Then close the terminal compartment carefully to maintain protection. Make sure the cable entry is sealed properly.

Tighten central screw of the power lead socket to a maximum of 60Ncm. The housing must not show signs of deformation. Ensure correct polarity of terminals marked + and -. If unmarked the live wires can be connected either way round. It is absolutely essential to connect the earth wire to the marked terminal provided.

DANGER! Earth connection essential!

It is advisable to carry out an operating test before pressurising. The clicking of the plunger must be audible during switching.

The power lead socket may only be connected with the power disconnected. Operation of AC solenoids without the plunger causes irreparable damage.

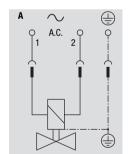

The surface of the solenoid will heat up to a maximum of +120°C during continuous duty.

TECHNICAL INFORMATION EC TYPE EXAMINED VALVES TO DVGW (GERMAN GAS INSTALLATION AND PLUMBING ASSOCIATION) REQUIREMENTS

Firing systems, gas turbines and other oil and gas appliances are operated with safety valves that shut off the fuel supply should dangerous conditions arise. Type examination is mandatory to establish their suitability for this purpose.

For the gases specified by DVGW Code of Practice G 260, the requirements of EN 161 and DIN 3394 Part 1 have to be met for working pressures in excess of 4 bar. Liquid fuels are governed by the requirements of EN 264.

The old DIN DVGW registration number has been superseded in the course of EU harmonisation.

Safety shut-off valves are not gas appliances ready for use as defined in the Gas Appliance Directive. The valves are marked with the CE product identification number rather than the CE mark.

Buschjost has developed 3 series of electrically and electropneumatically actuated valves. The 82580 series is only suitable for gaseous fuels, the others cater for gaseous and liquid fuels.

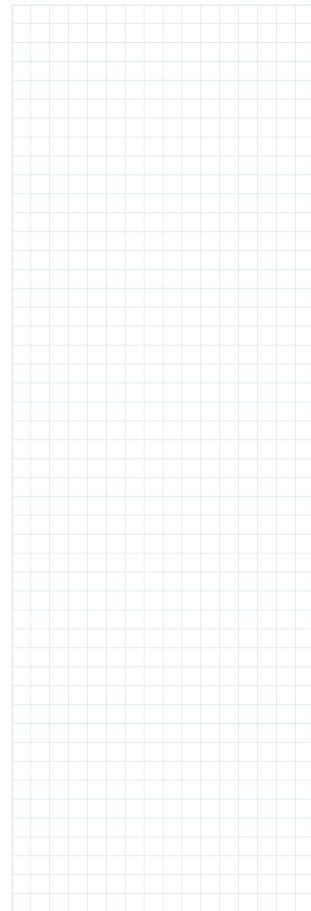

These valves are described in greater detail on their data sheets.

TECHNICAL INFORMATION AMMONIA & VALVES

Solenoid valves are used to control ammonia refrigerants.

There is a special range of Buschjost valves designed to meet the stringent and specific safety requirements for this application, through:

- Avoidance of nonferrous metals
- Use of special seal materials
- High tightness to atmosphere to prevent emissions
- Explosion protection
- Position indication
- Type approval
- Design to power station specifications
- Grooved connecting flange to DIN 2512, type NA

The Buschjost range of equipment for use in ammonia systems includes various sizes and types of solenoid valves and pressure actuated valves.

We will gladly provide you with any further information required.

2/2-way valves DN 15 - DN 100

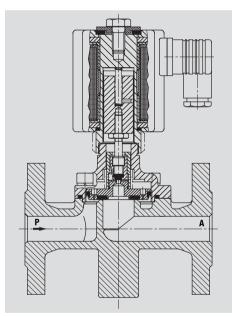

solenoid actuated, with forced lifting flange connection PN 40

DESCRIPTION (STANDARD VALVE)

Type Switching function Operating pressure Differential pressure Process fluid Fluid temperature Ambient temperature Viscosity Flow direction Mounting position piston valve normally closed 0 to 25 bar not required neutral liquids and gases -10 to maximum of +90°C -10 to maximum of +50°C up to 40 mm²/s determined DN 15 - DN 50 optional, preferably with solenoid upright DN 65 - DN 100 with solenoid upright only

84200 85200

MATERIALS

Body Cover

Internal parts Seals Valve seat cast steel DN 15 - DN 50 brass DN 65 - DN 100 cast steel stainless steel, brass, gun metal NBR cast steel

FEATURES

- Damped operation
- · High flow rate
- · Variety of options
- For demanding industrial applications
- · Continuously adjustable closing time from DN 65
- Flange drilled to ANSI B 16.5 300 lbs RF

TECHNICAL INFORMATION **PROTECTION CLASS**

Protection

The Ingress Protection (IP) code always consists of the letters IP followed by two digits. It specifies the degree of protection to DIN VDE 0470 (EN 60 529) provided by enclosures of electrical apparatus. The first digit applies to protection against electric shock hazard and solid bodies, the second to protection against liquids. A letter indicating protection against access to hazardous parts may follow the last digit.

The individual protection codes are defined in the following table:

1st digit

Electric shock hazard protection and protection against solid bodies

0 No protection

- 1 Objects greater than 50mm
- 2 Objects greater than 12mm
- 3 Objects greater than 2.5mm
- 4 Objects greater than 1.0mm
- 5 Dust-protected
- 6 Dust-tight

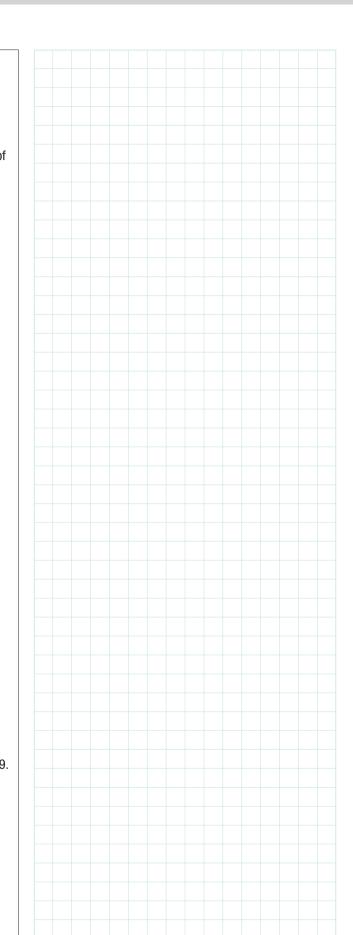

2nd digit

Protection against liquids

- 0 No protection
- 1 Vertically dripping water
- 2 Angled dripping water
- 3 Sprayed water
- 4 Splashed water
- 5 Water jets
- 6 Heavy seas
- 7 Effects of immersion
- 8 Indefinite immersion

The exact definitions from which these abbreviated descriptions are derived are to be found in DIN EN 60529.

Special regulations have to be followed when using solenoids in hazardous areas.

TECHNICAL INFORMATION MATERIALS METALLIC

Material selection

Information about the concentration, temperature and the degree of contamination of the fluid is important in making the right choice of materials. Further criteria are the operating pressure and maximum flow rate. As well as high temperatures, pressures and flow rates must be taken into consideration when choosing a material.

Brass (Ms 58) M. no. 2.0402 Has many applications, not suitable for aggressive and ammoniacal fluids.

Grey cast iron (G1/4-25)M. no. 0.6029Mainly for flanged valve bodies up to PN 16, the temperature
range is limited, suitable for neutral fluids.

Spheroidal cast iron (GGG-40.3) M. no. 0.7040 Mainly for flanged valve bodies up to PN 16, suitable for neutral fluids.

Cast steel (GS-C 25) M. no. 1.0619 Mainly for flanged valve bodies up to PN 40, high temperature range, suitable for neutral fluids.

Gun metal (Rg 5)M. no. 2.10(CuSn 5 ZnPb)Seawater,mildly aggressive water or steam.

Cast stainless steel M

(G-X 7 CrNiMo 18 10) Austenitic high-alloy steel for aggressive fluids.

Stainless steel - Ingot material
(X 10 CrNiMoTi 18 10)M. no. 1.4571Austenitic high-alloy steel for aggressive fluids.

Stainless steel M. r

(X 5 CrNi 18 9) Low-alloy austenitic stainless steel for valve's internal parts.

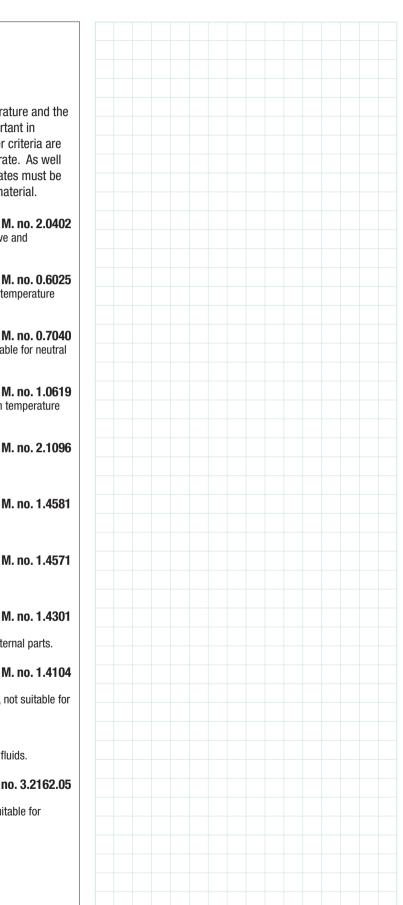

Stainless steel M. no. 1.4104 (X 12 CrMo S 17)

Corrosion-resistant magnetisable stainless steel, not suitable for aggressive fluids or seawater.

Sandvik Stainless steel 1802

Magnetic stainless steel, suitable for aggressive fluids.

Aluminium M. no. 3.2162.05 (AISi 8 Cu 3) Aluminium die casting for bodies up to PN 16, suitable for neutral fluids.

2/2-way valves G ³/₈ - G 1 solenoid actuated, with forced lifting

threaded connection

TECHNICAL INFORMATION MATERIALS POLYMER

Materials

The design of the valve is decided by the application, with the materials ability to resist the operating fluid constituting an important factor.

Information about the concentration, temperature and the degree of contamination of the fluid is important in making the right choice of materials. Further criteria are the operating pressure and maximum flow rate. As well as high temperatures. pressures and flow rates must be taken into consideration when . choosing a material.

All of the materials used for the bodies, seals, solenoids etc of Buschjost valves are carefully selected to suit the different applications.

Plastics for valve bodies

PVC

Polyvinylchloride Resistant to most acids, alkalis, salt solutions and organic solutions miscible with water. Not resistant to aromatic and chlorinated hydrocarbons.

PVDF

Polyvinylidenfluoride Suitable for nearly all aggressive fluids in the temperature range from -20 to +100°C.

PFA

Perfluoralkoxy As resistant as PVDF but in a higher temperature range from -20 to +150°C.

PP

Polypropylene Resistant to aqueous solutions of acids, alkalis and salts, depending on concentration and temperature.

POM

Polyoxymethylane

A material with a high degree of hardness and low water absorption. Not suitable for bases, acids or oxidation agents.

2/2-way valves G ¹/₄ - G ³/₈ direct acting solenoid valves

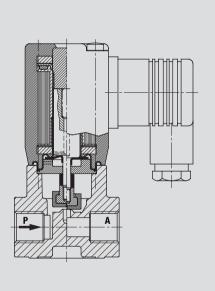

direct acting solenoid valve threaded connection

TECHNICAL INFORMATION SOLENOID VALVES WITH DIFFERENTIAL PRESSURE

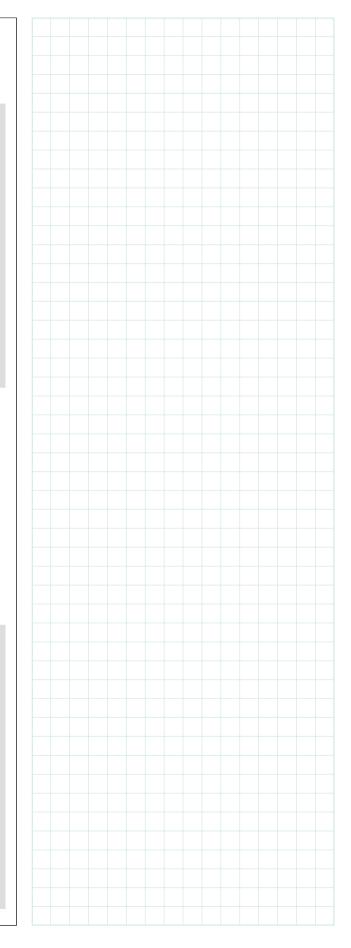

(servo assisted, pilot operated or indirect acting)

These valves operate on the servo assistance principle, which requires a specified differential pressure for opening and closing. The solenoid opens the pilot seat. This relieves the pressure on the main closure device, which is raised into the open position by the increasing effective force on its underside.

Closure of the pilot seat builds up a closing force on the main closure device via bleed orifices. Provided the inlet pressure is at least the required differential higher than the outlet pressure, the valve remains securely closed.

TECHNICAL INFORMATION SEAT VALVES

Buschjost solenoid valves are a seated design, with a diaphragm or piston for tight flow shut-off. The axial movement of this closure device opens and closes the valve seat.

The high density we achieved is optimised by using the appropriate combination of materials for each application.

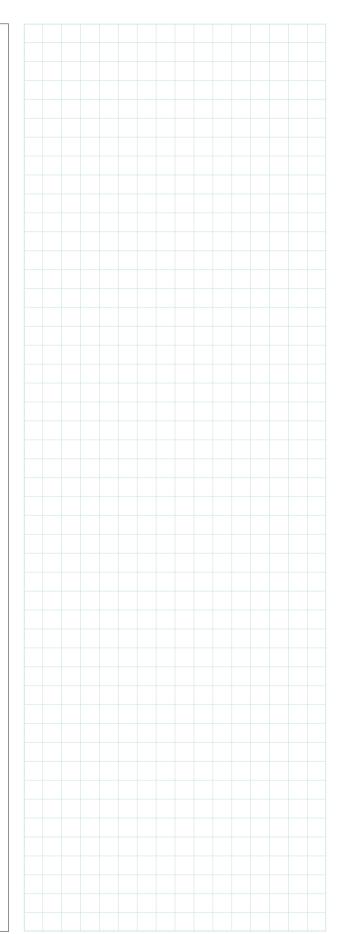

An internal piston is moved axially into the position required by the particular function. This type of valve is available in materials catering for relatively high pressure and temperature ranges.

Diaphragm seat valve

A specially shaped diaphragm clamped between body and cover is moved into the position dictated by the valve function. This extremely cost-effective design offers the ideal technology for use in systems with neutral gases and liquids.

TECHNICAL INFORMATION PRESSURE EQUIPMENT DIRECTIVE (PED)

The Pressure Equipment Directive (PED) is generally applicable to equipment with a working pressure greater than 0.5 bar. Valves as components of this equipment come under the scope of the directive. However, only valves above a certain nominal size are required to bear CE markings.

Valves suitable for different (e.g. neutral, toxic or flammable) fluids only require CED markings above a nominal size of DN 25. Smaller valves **must not** bear a **CE mark in accordance with the Pressure Equipment Directive**. This equipment must be designed in line with standard engineering practice so that it meets the requirements of the directive.

Almost all of the valves over DN 25 in size requiring marking should be assigned to Categories I and II. This means their design and testing is in the responsibility of the manufacturer, ie Norgren Buschjost in the case. Module A1 has been chosen ass the related method of evaluating conformity and certified by the "nominated body" (TÜV Nord).

The products are also subject to other EU Directives such as EMC, Low Voltage, etc. The products bear a CE mark as a declaration of conformity with all of these. Where applicable (sizes > DN 25) this mark also serves as a declaration of conformity with the Pressure Equipment Directive. Category II valves are also marked with the identification number of the nominated body; CE 0045 for TÜV Nord.

2/2-way valves G $^{1\!\!/_{\!\!4}}$ - G 1

pilot operated solenoid valves requiring differential pressure threaded connection

DESCRIPTION (STANDARD VALVE)

TECHNICAL INFORMATION GROUP MOUNTED VALVES

The inline series of angle valves was developed as a compact arrangement that minimises pipelaying costs.

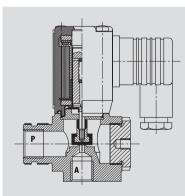

Three types are available to the user:

- The conventional servo assisted design requiring differential pressure, ND10 and 0.1 to 10 bar.
- A direct acting valve, with ND3 and ND4.5 valve seat and pressures up to 6 or 10 bar.
- A model with bellows specially protecting the plunger tube against dirt and limescale.

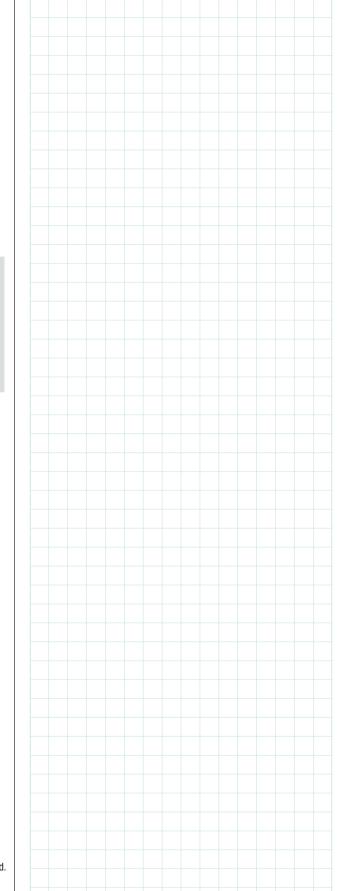

Up to 8 valves can be connected in line, with a common supply inlet. Individual switching is used to vary the consumption or control the required loads.

Individual valves can be isolated to form two separate circuits controlling different media.

Individual valve with sealed plunger tube

We will gladly provide you with any further information required.

2/2-way valves G ³/₈ pilot operated solenoid valves

pilot operated solenoid valves requiring differential pressure threaded connection

DESCRIPTION (STANDARD VALVE)

Type Switching function Operating pressure Differential pressure Process fluid Fluid temperature Ambient temperature Viscosity Flow direction Mounting position diaphragm valve normally closed 0.1 to 10 bar 0.1 bar required neutral liquids and gases -10 to maximum of +90°C -10 to maximum of +50°C up to 25 mm²/s determined optional, preferably with solenoid upright

MATERIALS

Body Internal parts Seals Valve seat brass stainless steel, PVDF NBR brass

FEATURES

- Very small weight and installation dimensions
- For exacting process systems
- Various combination possible
- Connection up to 8 valves without pipework
- Damped operation

TECHNICAL INFORMATION STEAM, HOT WATER & VALVES

Process engineering valves for steam and hot water have to withstand pressure and heat. Valve selection must take account of any influencing factors.

Solenoid valves with the following features are suitable:

- Seated design
- Heat-resistant seals
- Suitable material combinations
- Powerful, heat-resistant solenoids
- Corrosion resistance
- High tightness to atmosphere
- Tight valve seat seal
- Optional position indicators
- Variable mounting position
- High durability
- Glandless valve system

TECHNICAL INFORMATION EMC ELECTROMAGNETIC COMPATIBILITY

Electromagnetic compatibility is the ability of an item of equipment, installation or system to work satisfactorily in the electromagnetic environment, without itself causing electromagnetic interference that would be unacceptable for all of the other equipment present.

EU Declaration of Conformity (sample)

We hereby declare that all IMI Norgren Buschjost GmbH + Co. KG solenoid actuators marketed under our sole responsibility conform to the EU Directives listed below. Unauthorised modification invalidates this declaration.

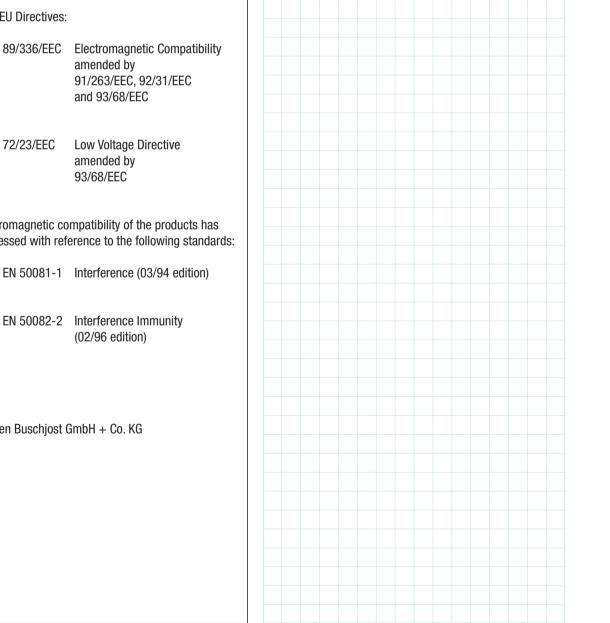

Relevant EU Directives:

- 89/336/EEC Electromagnetic Compatibility amended by 91/263/EEC, 92/31/EEC and 93/68/EEC
- 72/23/EEC amended by 93/68/EEC

The electromagnetic compatibility of the products has been assessed with reference to the following standards:

EN 50082-2 Interference Immunity (02/96 edition)

IMI Norgren Buschjost GmbH + Co. KG

2/2-way valves DN 65 - DN 150 pilot operated solenoid valves

pilot operated solenoid valves requiring differential pressure flange connection PN 16

ELECTRICAL DATA

Standard voltage	DC 24V	AC 24V 42V 110V 230V	50Hz 50Hz 50Hz 50Hz
Power consumption Solenoid 9366	DC 18W -	AC inrush holding	106VA 35VA
Duty cycle Voltage range Protection Electrical design	100% ±10% without power lead socket IP00 with power lead socket IP65 arrangement and testing to DIN VDE 0580		

NOTES:

The power consumption is measured according to VDE 0580 at a coil temperature of $+20^{\circ}$ C. Physical factors reduce the value by up to about 30% when the DC solenoid coil has reached normal operating temperature.

Power lead socket type A Socket can be turned to 4 positions 90° apart Solenoid can be turned in any direction

The conditions imposed on the Ex approvals lead to reduction of the permissible standard temperature ranges in the case of explosion protected solenoids.

Valves must be suitably protected against contaminated fluids.

The closing time can be adjusted with the valve stem (302). Screwing in increases the time and vice versa. Full opening or closing of the control passage will cause the valve to malfunction.

TECHNICAL INFORMATION **PRESSURE ACTUATED VALVES**

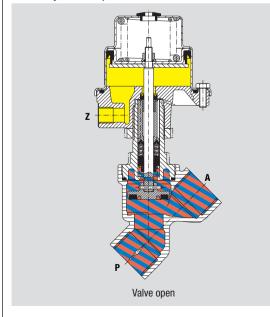

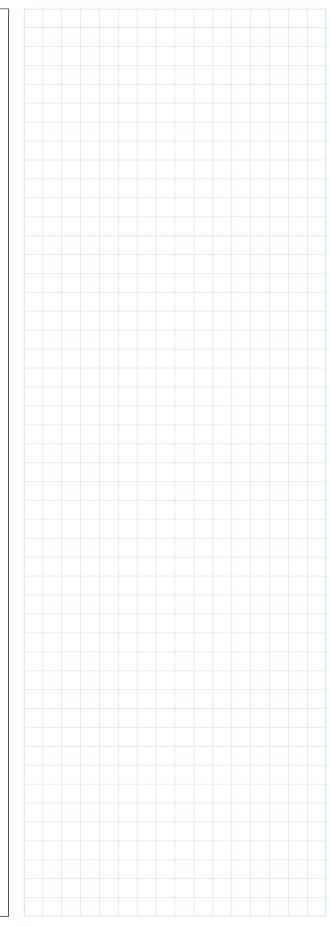

(pneumatically actuated isolating valves)

This type of valve is controlled by a pilot fluid supplied to the actuator by means of a pilot valve.

A stem connects the closure device to the control member of the actuator. The spring acting on the control member forces the closure device down into the closed position on the valve seat. The pilot supply overcomes the spring force to lift the control member into the open position.

These valves are mainly suitable for contaminated or extremely viscous process fluids.

TECHNICAL INFORMATION SEALING MATERIALS

Material selection

Information about the concentration, temperature and the degree of contamination of the fluid is important in making the right choice of materials. Further criteria are the operating pressure and maximum flow rate. As well as high temperatures, pressures and flow rates must be taken into consideration when choosing a material.

NBR

AcryInitrile Butadiene India Rubber

Standard flexible material for neutral fluids such as air, water, oil. Good resistance to mechanical loads. Temperature range depending on working conditions from -10 to $+90^{\circ}$ C.

HNBR Hydrogenated Nitrile Rubber Similar in many features to NBR. Particularly suitable for hot water and steam. Temperature range depending on working conditions from -20 to +150°C.

EPDM

Ethylane Propylene India Rubber

Resistant to alkalis and acids of fluid concentration, water, hot water and steam Not resistant to oils and greases. Temperature range depending on working conditions from -20 to $+130^{\circ}$ C.

FPM

Fluoride India Rubber

A highly temperature- and weatherproof elastomer. Suitable for many acids, bases, fuels and oils (including synthetic). Not resistant to steam. Temperature range depending on working conditions from -10 to $+180^{\circ}$ C.

CR

Chloroprene India Rubber

Similar in many features to NBR. Particularly suitable for most refrigerants. Temperature range depending on working conditions from -20 to +90°C.

PTFE

Polytetrafluoroethene

A duroplastic, not a flexible material and therefore not suitable for the conventional diaphragms (separating membranes are possible). Resistance is almost universal in the temperature ranges from -20 to +200°C.

Valve bodies and internal parts are also made of this material.

FFPM

Perfluoride Elastomer

A flexible material with the same resistance as PTFE and excellent sealing qualities. Temperature range depending on working conditions from -30 to +200°C.

TPE

Thermoplastic elastomers

Very durable yet flexible over a wide temperature range. Resist oils, grease, many solvents and weathering.

TECHNICAL INFORMATION **PRESSURE RANGES**

The valves must be operated within the pressure ranges specified in the separate publications.

The commissioning procedure must include a check on whether the actual pressures agree with the data on the valve name plates.

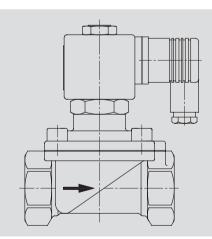

With vacuum operation, ensure that the negative pressure is present at the valve outlet.

Observe the minimum differential pressures specified for servo assisted valves in the characteristic data of the publications.

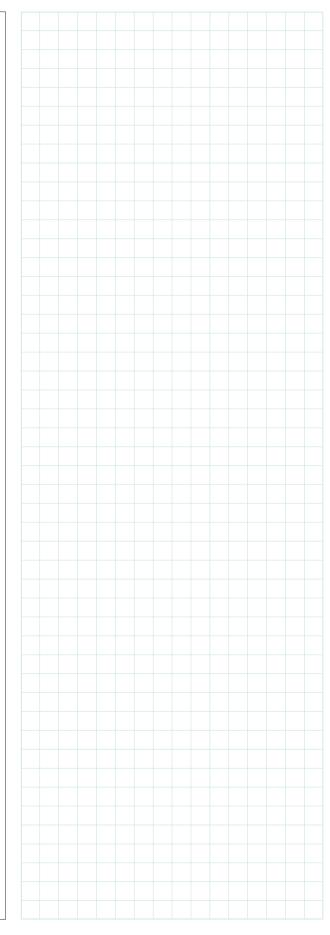

The difference between the inlet and the outlet pressure is the effective differential pressure.

The permissible static pressure in a system is the nominal pressure. Working and nominal pressure can differ depending on the type of valve. The valve will continue to operate up to the maximum permissible working pressure.

The valves will only close provided the specified direction of flow is observed. Flow in the opposite direction may irreparably damage components.

An arrow marked on the body of the valve indicates flow direction.

TECHNICAL INFORMATION VACUUMS & VALVES

The term vacuum is used loosely for any gas pressure lower than atmospheric, i.e. a negative pressure. The unit of measurement is the millibar (mbar) or hecto pascal (1 hPa = 1 mbar).

The user often specifies the degree of vacuum as a percentage. For example, a relative vacuum of 40% indicates an absolute residual pressure of 600 mbar.

Most mechanical engineering applications of solenoid valves or pressure actuated isolating valves lie within the rough vacuum range.

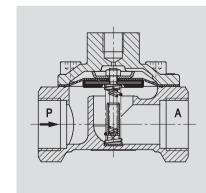

Since only very small differential pressures are available in this type of application, valves that optimise the flow and therefore have a high coefficient (K_v) should be chosen. These valves should also operate without differential pressure.

The actual pressure regime has to be carefully examined before valves requiring differential pressure can be used.

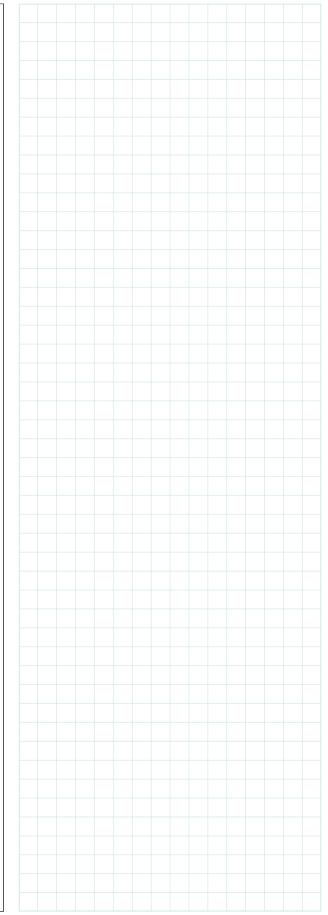

Valves must always be mounted so the flow is from P to A, ie the vacuum has to be present at their outlet.

The supply available to actuate the valve against the vacuum must be sufficient to move the closure device into the open position and hold it there during the system sequence.

If this supply is interrupted, the vacuum, assisted by the forces tending to close the valve, will shut the valve by forcing the closure device back onto its seat.

We will gladly provide you with any further information required.

TECHNICAL INFORMATION OXYGEN & VALVES

Increasing importance is being attached to the safe handling and control of oxygen.

Buschjost has had the **Bundesanstalt für Materialforschung and -prüfung** (BAM) (German Federal Institute of Materials Research and Testing) carry out the necessary tests for certain series of valves.

The materials in contact with the medium in the following valves conform to the German Safety Regulations for Oxygen (UVV Sauerstoff VBG 62). All nonmetallic materials have been subjected to a special test by the BAM.

Valve testing covers the following criteria:

- Material strength and durability.
- Burnout resistance under pressure surge.

Oxygen up to 16 bar

82 400 **36**.9101 series Technical requirements: Working pressure up to 16 bar Pressure rating PN16 Degreased FPM seals Maximum fluid temperature +60°C Maximum ambient temperature +60°C

Oxygen up to 25 bar

The type and materials of the following types of valve were tested by the BAM for burnout resistance at higher pressures. The valves can be used for oxygen at up to 25 bar.

Technical requirements: Working pressure up to 25 bar Pressure rating PN25 Degreased FPM seals Maximum fluid temperature +60°C Maximum ambient temperature +60°C

TECHNICAL INFORMATION NAMUR ADAPTER PLATE

for the 84500, 84520 and 84540 isolating valves

An adapter plate can be used to mount pilot valves with NAMUR interface on the actuators of these valve series.

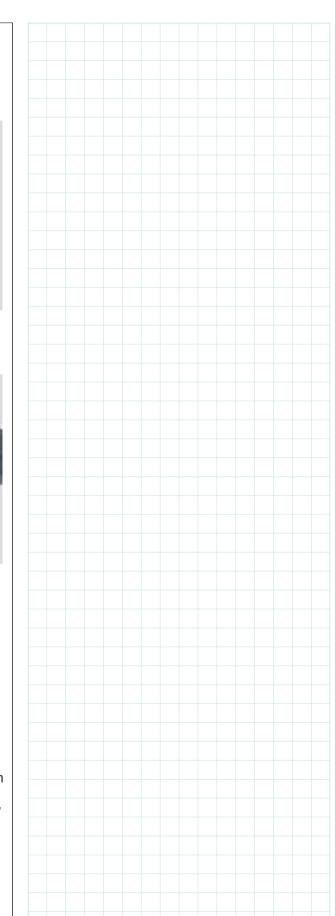

STROKE LIMITING SYSTEM

For 84500, 84520 and 84540 isolating valves

This system is available as an option for adjusting the minimum and maximum flow rate.

It can also be retrofitted after removal of the standard position indicator.

TECHNICAL INFORMATION **PH-VALUE**

The pH-value represents a measure of the neutrality, acidity or basicity of an aqueous solution.

Pure water is neutral and has a pH of 7. The range below 7 is described as acidic and that above as basic or alkaline.

	(water) -5-6 7 8-9-10-11 yeak) (weak)	(lye) 12-13-14 (strong)
--	---	-------------------------------

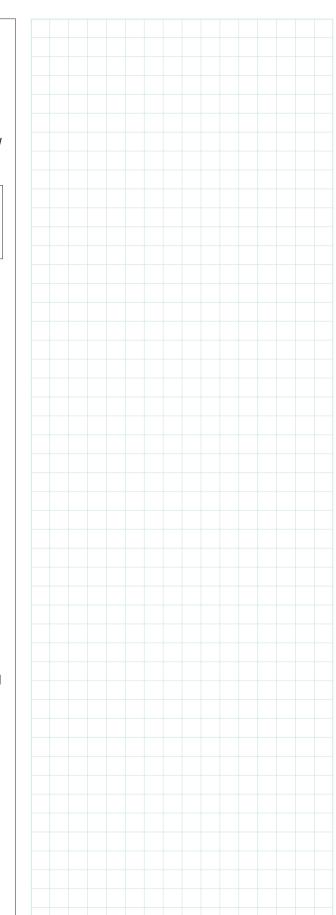

A strong acid has a low pH.

A value of 5.5 is unlikely to cause skin irritation.

VISCOSITY

The kinematic viscosity in mm²/s is a measure of the internal friction of gases and liquids. It represents the resistance to movement of the contact surfaces of adjoining layers of different (external friction) or identical (internal friction, viscosity) material.

The viscosity depends on pressure and temperature, and decreases with increasing temperature. Its value is measured at $+20^{\circ}$ C from the rate of efflux from capillaries or speed at which balls sink in test fluids.

TECHNICAL INFORMATION **SOLENOID HEATING**

The solenoids are normally designed for continuous duty, so under normal conditions there is no danger of the permanent operating temperature of the coil reaching an impermissible value.

The coil temperature that is reached during operation is influenced by 3 factors:

- the intrinsic heating
- the temperature of the fluid flowing through
- the ambient temperature

The highest permissible solenoid temperature is generally determined by the thermal durability of the material used for insulation.

In order to ensure that there is no thermal damage, the specifications for the maximum permitted fluid and ambient temperatures should not be exceeded.

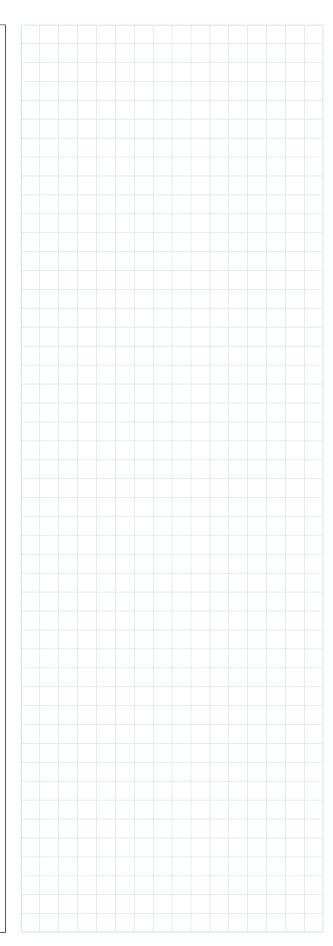

In this context, particular attention should be paid to the power consumption of the solenoids. Many valve manufacturers give their power consumption at operating temperature, which is lower than the specifications given in this catalogue, because of the high coil resistance.

Particular attention should be paid to the passage in the Buschjost data sheets:

The power consumption is measured according to VDE 0580 at a coil temperature of +20°C. Physical factors reduce the value by up to about 30% when the DC solenoid coil has reached normal operating temperature.

The actuating solenoids are offered with a range of different connections. The most common are the sockets to DIN 43 650, terminals in the terminal compartment with cable passing through a Pg gland or directly encapsulated in the coil area (flying lead).

At continuous duty the surface temperature of the solenoid can reach up to 120°C.

TECHNICAL INFORMATION **SOLENOIDS**

General

Valve actuating solenoids are designed for the service conditions and conform to VDE 0580.

Power supply, voltage ranges

The preferred voltages are specified in the separate publications.

Special voltages are possible on request. The permissible voltage range is $\pm 10\%$ of the nominal value.

Type of supply

Solenoids are available for connection to a DC or AC supply.

Those designed for AC may only be used at the specified frequency.

The more powerful solenoids are a DC design. They can be operated off an AC supply via a rectifier, which is connected in series as standard. The permissible frequency is then 40 to 60Hz.

Duty cycle

All standard solenoids are designed for continuous duty in order to rule out the possibility of the winding overheating during normal service conditions.

DC solenoids

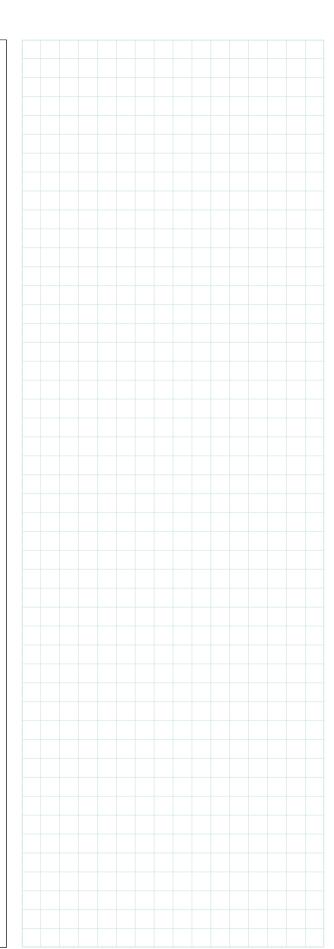

The main advantage of this type is constant current consumption. This gives soft switching and makes the winding less sensitive to binding of the plunger. The maximum frequency of operation is only limited by the system's electrical and mechanical inertia.

AC solenoids

The current consumption of this system depends on the position of the plunger. The plunger must be able to reach its limit unhindered, otherwise the winding will overheat.

Special spark quenching is generally not necessary.

Ensure that the mains frequency agrees with the value specified on the name plate. If it is higher, the solenoid will develop less force and may burn out, since the plunger cannot reach its limit. At a lower frequency the smaller inductive reactance causes more heating, which can influence the lifetime of the coil.

TECHNICAL INFORMATION **POSITION INDICATOR**

Noncontact electric type

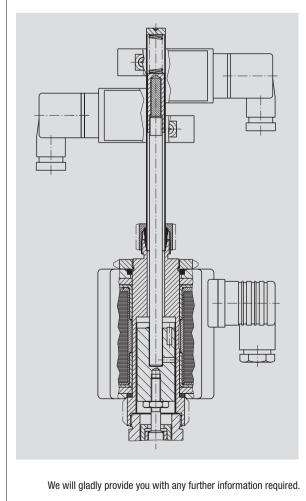

This indicator has two magnetic switches; one for the CLOSED and one for the OPEN position of solenoid and pressure actuated valves.

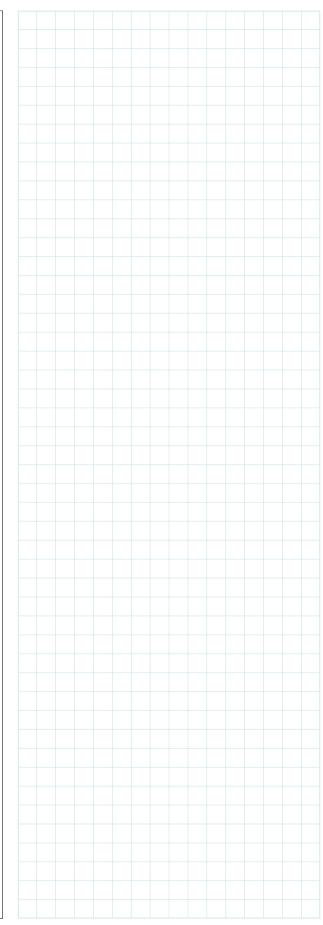

The reed contact of the switch is deflected by a permanent magnet tightly screwed into a spindle. This spindle is connected to the valve piston or stem.

These indicators can be mounted with IP65 or $\ensuremath{\mathsf{EEx}}$ protection.

Features

- Emissionproof, switching magnet incorporated in valve system
- Easily mounted in any position
- Small valve strokes detected
- Accurately reproducible switching points
- Glass fibre reinforced thermoplastic housing
- Good mechanical and electrical durability

TECHNICAL INFORMATION DUST COLLECTOR VALVES AND SYSTEMS

Valves

Filter pulse valves produce the pressure intensity crucial for effective cleaning of filter media with compressed air.

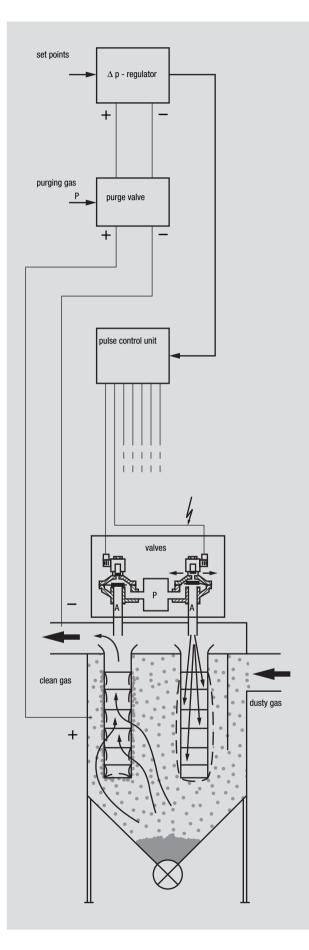

To meet the requirements these valves have to be designed to open and close extremely quickly and allow high flow rates. This response also reduces air consumption.

Control systems

An electronic control unit or pneumatic controller presets the duration of the pulse and interval required of the valves in this application. These control systems actuate the valves directly. The timing can be adjusted if service conditions change.

Differential pressure regulator

This regulator initiates cleaning on the basis of the differential pressure between the dusty and clean gas sides of the filter. When the pressure drop across the filter reaches the preset upper limit, the regulator actuates the cleaning valves by means of the control system. Cleaning is interrupted immediately the lower limit is reached. This type of control extends the life of the filter media and valves. Another bonus is considerably reduced air consumption.

TECHNICAL INFORMATION MANUAL OVERRIDE KNOBS

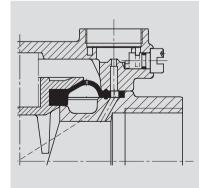

If the actuating supply fails, solenoid and pressure actuated valves are brought into their normal position.

A manual override knob then allows the valve to be opened or closed.

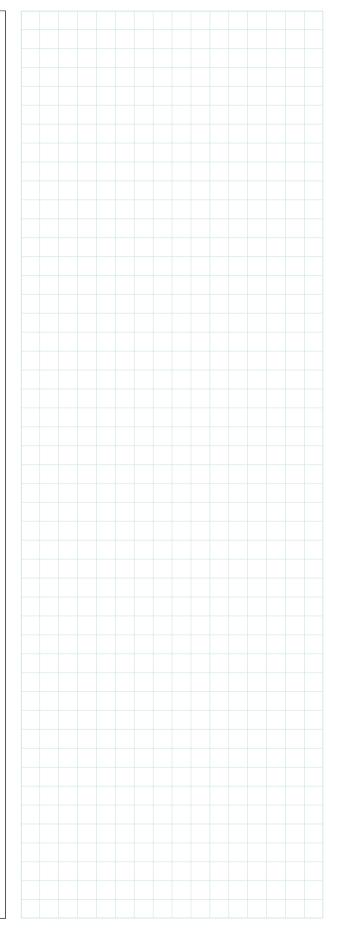

A wide variety of alternative types are offered to cater for the different valve designs.

We will gladly provide you with any further information required.

TECHNICAL INFORMATION DUST COLLECTOR VALVES & FACTS

The 82960 series solenoid system with bayonet connection is easily mounted – just push down and turn.

The internal components of the pilot system are captive.

The plastic encased solenoid can be turned to 3 different positions, 120° apart, without using tools.

The factory fitted silencer prevents annoying noise and stops ingress of foreign matter into the valve.

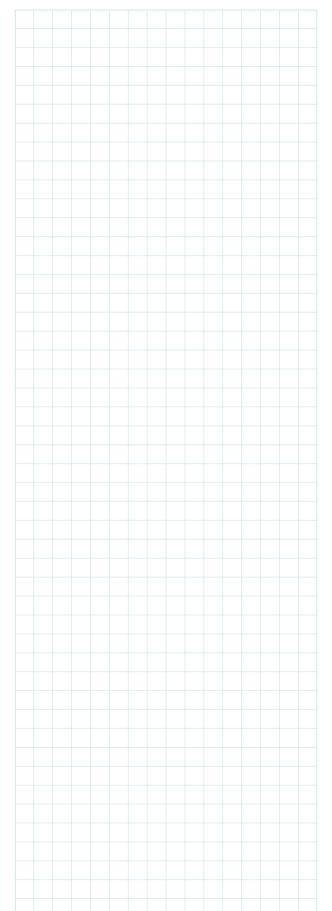

The solenoid design of the pilot offers maximum security against icing.

The volume above the diaphragm is minimised for extremely fast opening with optimised peak pressures. The similarly ideal closing time ensures low air consumption.

All of the dynamically loaded valve elements are designed to last.

The various parts of the case are designed for high air flow.

Available with internal BSP or NPT threaded connection to international standards.

TECHNICAL INFORMATION PNEUMATIC VALVE CONTROLLER

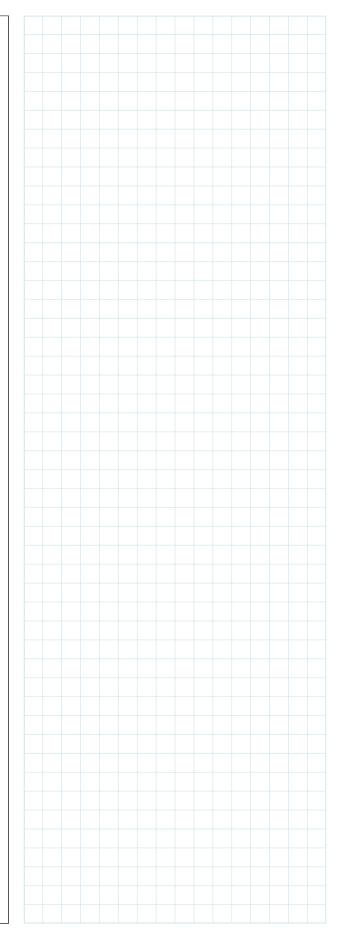

Operation of filter systems in difficult environments or hazardous areas necessitates expensive electronic control systems and solenoid valves. Pneumatic control systems offer an effective technological alternative at the right price.

Principle of operation

The valves are connected to the pressure chamber of the controller by air lines. The wiper arm assembly of the controller is operated by a pneumatic ratchet drive. It pauses between valve connections for an interval that can be preset by the user. The duration of the air pulse is also user adjustable by means of a throttle valve accessed after removal of the bottom casing. During this period the wiper arm passes beneath a valve connection port and vents the pilot line to that particular valve. The valve opens and remains open until the wiper arm moves on to the next position. The pilot air is vented through the port marked R.

A spring return mechanism positions the wiper arm assembly reliably during each interval of the intermittent operation.

TECHNICAL INFORMATION DUST COLLECTOR VALVES & TIMER SOLENOID

Solenoid with built-in electronic timer

Combination with a timer built into the solenoid offers a way of cleaning filter systems with just one filter pulse valve.

The necessary terminals and two graduated potentiometers for separate adjustment of pulse duration and interval are behind the solenoid's cover.

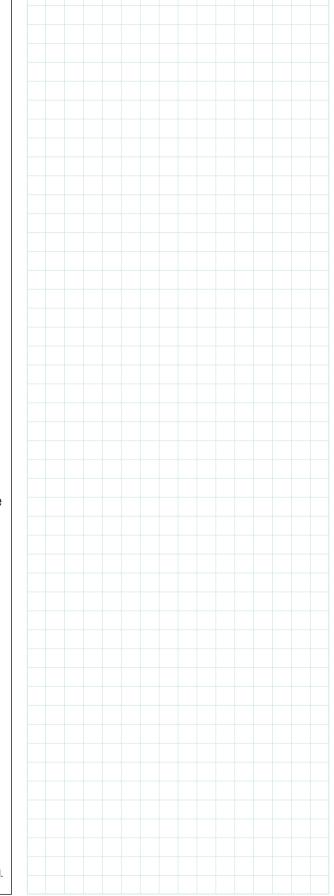

When power is supplied to the solenoid, the electronic control system is activated with a pulse in the preset time window. This repeated sequence of pulse followed by interval is maintained until the power supply is interrupted.

The time ranges that are typically used for this application are made available.

We will gladly provide you with any further information required.

Electronic pulse control unit

for valves in dust filter systems

DESCRIPTION

Type Outputs Principle of operation electronic pulse control unit 10, expandable to 30 Continuous actuation of the valves according to the preset pulse duration and interval. Differential pressure dependent control when combined with one of the 83400 series of differential pressure regulators.

02	neutral (0V for DC model)
03+04	terminals for external floating contact,
	START/STOP input, K1 closed:
	cleaning performed
05+06	0 to 20mA analog input for external control
	of interval
07-28	terminals for solenoid valves 1 to 10

IMPORTANT NOTES

Connecting the power supply for the DC model the wrong way round will blow fuse SI1.

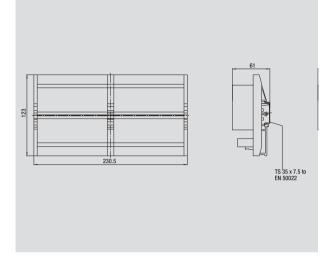

Standard unit and expansion units must be mounted right next to each other. An 0.5 metre long ribbon cable fitted with 3 female connectors is supplied with each expansion unit.

If S1 is in the middle position when the power is switched on, the control system shortens the interval to about 50 to 1050ms. This mode may only be activated briefly for test purposes. Normal operation can be resumed by moving the switch to one of its other positions, then switching the power off briefly.

Plugs for PG11 cable glands are supplied with the IP65 model. The actual glands required for installation have to be ordered separately (Cat No 1230157).

DIMENSIONAL DRAWING 01

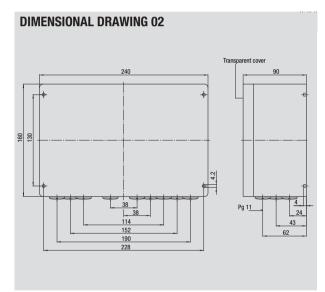

Description of operation

When the power is switched on, outputs 1 to 10 are activated cyclically according to the pulse duration and interval set. The number of outputs to be controlled can be preset with potentiometer P3. The interval can also be controlled via the 0 to 20mA input. The potentiometer setting affects the interval in this case. The operating sequence can be interrupted with the aid of the external contact K1 and continued later. 2 modes of operation are therefore possible.

1. ON/OFF operation

Pulse control is activated and deactivated by means of an ON/OFF signal. This signal can be derived from a Buschjost differential regulator, which gives the cleaning command via a relay output when the dust build-up on the filter reaches an upper limit. The control unit actuates the filter valves until the layer reduces to its lower limit. Cleaning then stops until the dust builds up the upper limit again, when it recommences.

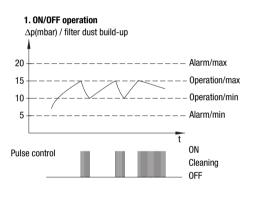

DIMENSIONAL DRAWING 03

07.5

108

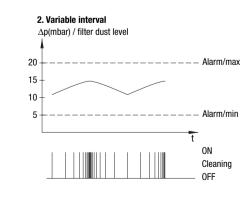

228

1.5

2. Varying the interval as a function of the dust build-up

The Buschjost differential pressure regulator has a 0 to 10V / 0 to 20mA analog output, which provides a measure of the dust build-up on the filter. To avoid wide fluctuations in cleaning efficiency and build-up, the pulse control unit evaluates this signal and varies the interval accordingly; shortening the interval when the filter is dirty and vice versa.

83720

TECHNICAL INFORMATION FILTER CLEANING & DIFFERENTIAL PRESSURE REGULATORS

The 83400 series of regulators can be used in combination with the 83720 series of electronic pulse control units to automatically adapt the cleaning to the dust loading.

A dust-resistant piezoresistive pressure sensor measures the differential between the clean and dusty sides of the filter system, which depends on the build-up, and provides a continuous digital readout.

All of the settings can be programmed with the buttons.

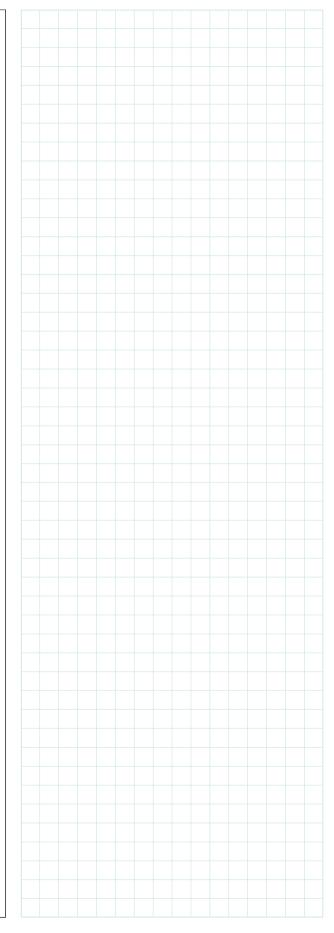

The host pulse control unit continues to operate until cleaning has progressed to the extent where the preset limit is reached. Any after-cleaning programmed is then started. Its duration is adjustable.

Two other switching points, Alarm 1 and Alarm 2, set above or below the set points as required, can be used to give an alarm in the event of faults.

The switching outputs can also be operated manually.

The regulator can be switched between 0 to 10V, 0 to 20mA or 4 to 20mA analog output signals and can be operated off 230V AC or 24V DC.

The unit conforms to the Electromagnetic Compatibility Directive 89/336/EEC and the Low Voltage Directive 73/23/EEC.

TECHNICAL INFORMATION DUST COLLECTOR VALVES & PRESSURE RISE TIME

Background

The valves used are designed to release almost explosive pulses of air that shake the dust particles off the filter bags.

However, this method is not effective if the pressure rises too slowly or the flow coefficient (K_v) of the filter pulse valve is too low. The nominal diameter of the valve also has to match the filter volume. The **flow coefficient** and the **pressure rise time** therefore represent the most important technical parameters for filter valves.

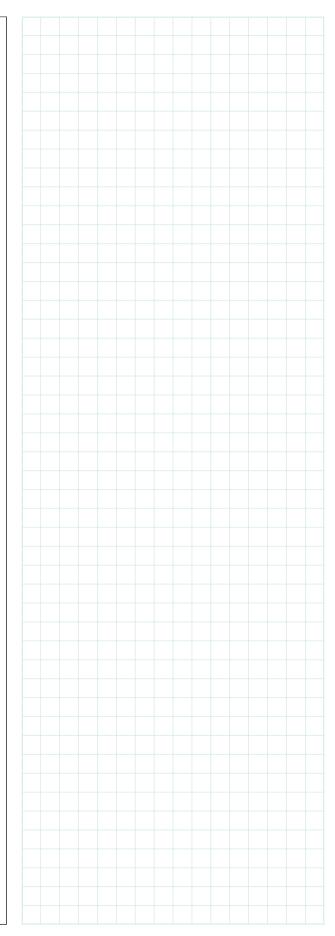

Reasons

If the pressure rises too slowly, the flow rate increases too gradually to shake the dust off the filter bags. Effective cleaning therefore requires the valve to open abruptly and blow a very short burst of compressed air (just a few milliseconds) into the filter. If the flow time is too long (just a few hundred milliseconds), the cleaning is not much more effective, but the air consumption is much higher.

The dust is also not shaken off if the pressure increases very quickly but the air throughput is insufficient. The volume released is then too small to subject the filter bags to a shock wave.

Summary

For effective cleaning, the pressure rise time has to be very short and the flow coefficient (K_v) as large as possible.

Purge valve for cyclical cleaning of the measuring lines between differential pressure regulator and dust filter systems

DESCRIPTION

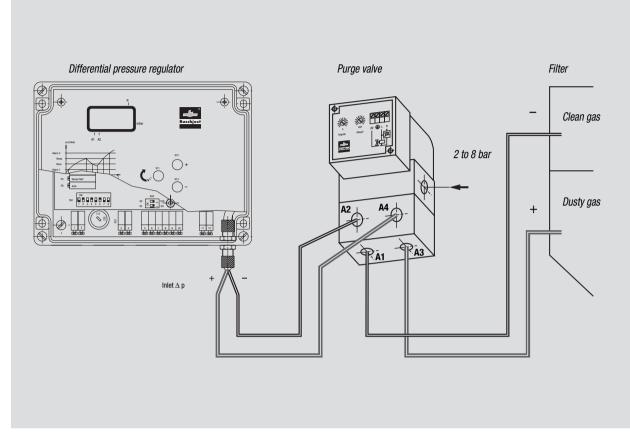

Part Number	8493571.8821.23050

TERMINALS ELECTRONIC TIMER SOLENOID

8493571

PRINCIPLE OF OPERATION

In filter systems with high dust loadings the purge valve makes it possible to avoid the measuring lines to the differential pressure regulator getting blocked. Both of these lines are cleared by short blasts of air controlled by a built-in solenoid valve. The dusty and clean gas measuring lines are routed via the purge valve to the differential pressure regulator. The cleaning air is supplied via port P.

A solenoid with built-in electronic timer actuates the valve so that it admits short pulses of air at long intervals into both measuring lines. To protect the sensor against pressure surges, prior to each blast of air the measuring lines are reliably shut off with nozzles. They are only reopened after the pressure has been reduced. The differential pressure regulator's display remains unchanged during the cleaning process.

TECHNICAL INFORMATION PROPORTIONAL VALVES MOTORISED VALVES

Production and process automation with electronic regulation and control equipment requires interfaces between the electronic and fluidic control loops.

The valve described below for regulating the flow rate of liquids and gases represents such an interface. Motorised valves are used wherever exact adjustment to the actual requirements is needed. There is a choice of different designs to suit the application and requisite accuracy.

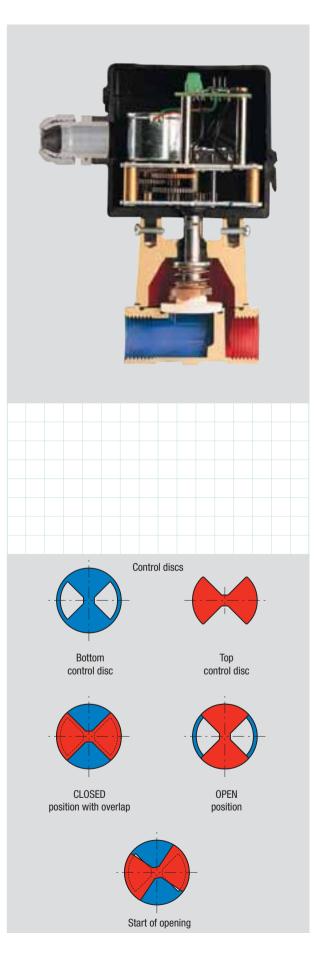

It is a rotary valve, with two oxide ceramic throttling disks that resist dirt and do not wear.

The maintenance-free electric actuator consists of a powerful, reversible motor; with a choice of DC, synchronous and stepper designs to suit different types of control system.

The control disc is rotated by the output shaft of gearing that is free from backlash to guarantee a reproducible control characteristic. 2 separate, floating microswitches detect the closed and fully open limits of the valve. The low power consumption of between 1.5 and 5W means the electronic regulator can drive certain types of motor directly.

Various motorised valve regulators and electronic components are offered to complement the valve in solving control problems of varying complexity, eg flow and temperature regulation kits, and electronic control cards such as a servo amplifier and stepper motor controller.

One of the two control discs opens two opposite triangular flow apertures in the other continuously, over an angle of rotation of 90°. The matching geometry of the pair of discs achieves a virtually linear flow characteristic. The particular throttling cross-section adopted is retained if the control voltage is switched off. The overlap in the closed position provides a sufficiently tight seal to prevent dripping.

TECHNICAL INFORMATION SERVO AMPLIFIER

for 82880 motorised valve

Electronic card for positioning valves with DC motor actuators.

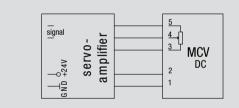

An electronically programmed set point of either 0 to 20mA or 0 to 10V can be used to adjust the aperture angle and hence the flow cross-section. A potetiometer in the actuator provides position feedback. Actual value and set point are compared in the amplifier.

A 0 to 20mA output is available for actual value feedback.

TECHNICAL INFORMATION ZERO DELTA P VALVES (DIAPHRAGM VALVES WITHOUT DIFFERENTIAL PRESSURE)

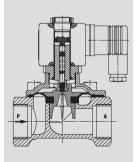

The Zero series is designed for reliable service in the vacuum and low-pressure range, where any differential pressure available is insufficient to allow the use of servo assisted solenoid valves.

It also caters for higher pressure ranges up to 16 bar. The pressure or vacuum level and presence of a differential are therefore no longer important considerations.

All these advantages add up to a universal design.

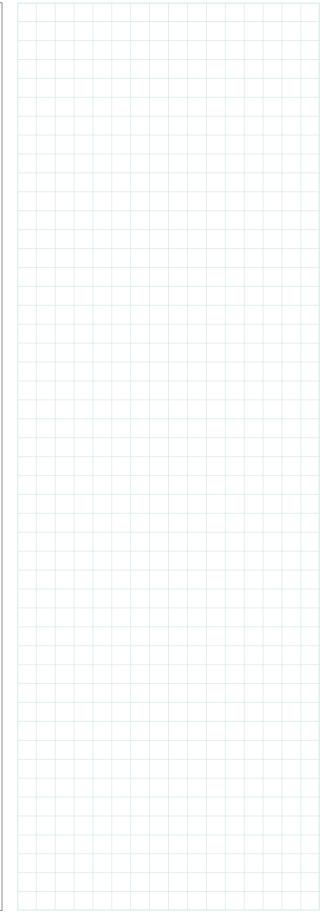

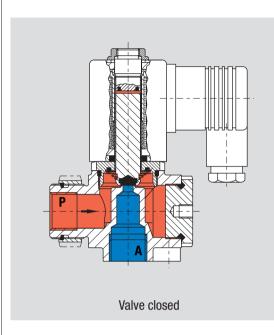

In the 0 to 16 bar pressure range the Zero series is available with G1/4 to G2 connections.

See pages 13 and 29 for further information.

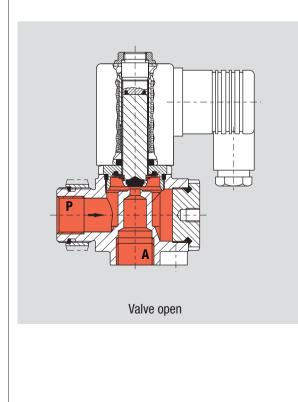

We will gladly provide you with any further information required.

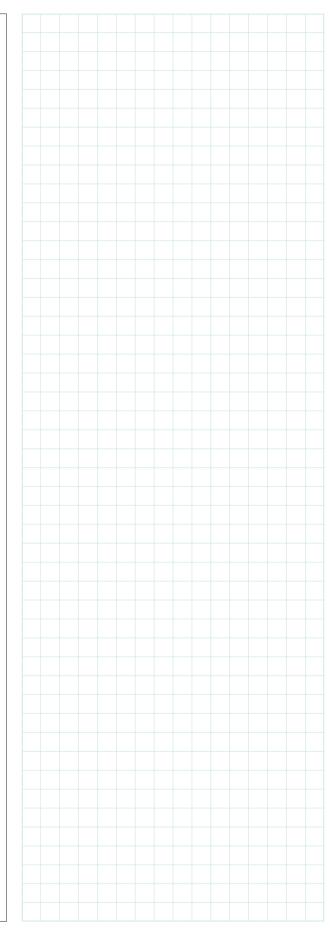

TECHNICAL INFORMATION SOLENOID VALVES WITHOUT DIFFERENTIAL PRESSURE (DIRECT ACTING)

This type of valve is actuated entirely by the solenoid force. The plunger with seal acting as main closure device is forced directly onto the valve seat by the fluid pressure and closing spring. The valve is opened directly by the solenoid force only.

WORLDWIDE PNEUMATICS EXPERTISE

Norgren stands for innovation, precision and quality. An exemplarily well rounded range of products has made this member of the IMI Group one of Europe's leading manufacturers of pneumatic components. International cooperation ensures technology transfer within the group and a high level of services in over 70 countries.
